

Address Autocomplete Anything

<https://wpdemo.net/demos/plugins/address-autocomplete-anything>

This plugin is unique in that it allows you to add a Google Address Autocomplete to *anything* on your WordPress website. It is not made to be specific for any one e-commerce, form, LMS, or other WordPress plugin... is compatible with them all!

Address Autocomplete is my favorite feature on any e-commerce site or any time I need to fill out a form on a website. Originally built for our other plugin, [Sunshine Photo Cart](#), I realized I could make this available to work for *anything*.

How it works

By using CSS selectors (don't worry non-tech person, it is easier than you think and a [simple help article and video is available!](#)), you can add Address Autocomplete to Anything! Provide a selector for which input field on your page you want to trigger the address autocomplete when a user types, and then the CSS selectors to target for the address data.

What you need

You only need to [get a Google Maps API key](#). Although billing info is required, *most* sites will never be charged as the free limit is quite high.
