

# Enable Media Replace

<https://wpdemo.net/demos/plugins/enable-media-replace>

A free, lightweight and easy to use plugin that allows you to seamlessly replace an image or file in your Media Library by uploading a new file in its place. No more deleting, renaming and re-uploading files!

Supported by the friendly team that created ShortPixel

## **A REAL TIMESAVER**

Don't you find it tedious and complicated to have to first delete a file and then upload one with the exact same name every time you want to update an image or any uploaded file inside the WordPress media library?

Well, no longer!

Now you'll be able to replace any uploaded file from the media "edit" view, where it should be. Media replacement can be done in one of two ways:

## **IT'S SIMPLE TO REPLACE A FILE**

1. Just replace the file. This option requires you to upload a file of the same type as the one you are replacing. The name of the attachment will stay the same no matter what the file you upload is called.
2. Replace the file, use new file name and update all links. If you check this option, the name and type of the file you are about to upload will replace the old file. All links pointing to the current file will be updated to point to the new file name.
