- Web developers: keep your clients' website pages in proper order during and after development. You can also mark a folder with a star or give it a unique name for clients to understand what is important and what they should (or shouldn't) touch.
- Bloggers: manage your own content with ease with this file manager plugin. Never get confused again – organize photos and content by topics, categories, and/or dates.
- Quickly upload pages, media, and content to your WordPress and easily organize them into directories so they're never lost. It's content creation and organization at its finest!
- Mark certain folders as important to quickly find the content you need for your WordPress projects and tasks. No worries about your content getting lost in a sea of directories!

- Media replace: replace media files with other files. Whenever you replace media, the change will reflect throughout your website on all your pages, posts, etc.

Note: adding a page/post/image into a folder will not change its URL. The folders plugin creates virtual folders, it doesn't create actual folders in your server or WordPress installation.
