

Redux Framework

<https://wpdemo.net/demos/plugins/redux-framework>

Redux is a simple, truly extensible and fully responsive options framework for WordPress themes and plugins. Built on the WordPress Settings API, Redux supports a multitude of field types as well as: custom error handling, custom fields & validation types, and import/export functionality.

But what does Redux actually DO? We don't believe that theme and plugin developers should have to reinvent the wheel every time they start work on a project. Redux is designed to simplify the development cycle by providing a streamlined, extensible framework for developers to build on. Through a simple, well-documented config file, third-party developers can build out an options panel limited only by their own imagination in a fraction of the time it would take to build from the ground up!
