

SMSocial

<https://wpdemo.net/demos/plugins/smsocial>

SMSocial Core provides the free local foundation for building a social community on WordPress. The WordPress.org distribution includes member profiles, canonical activity/feed publishing, people discovery, follows and connections, privacy controls, account security, responsive application navigation, reactions, comments, sharing and saved activity.

This WordPress.org package does not contain paid feature implementations or commercial runtime and does not use an external licence server to unlock functionality. Optional commercial add-ons are distributed separately by SMitov and are not required to use SMSocial Core.

SMSocial creates new accounts through email verification. Site owners can configure a transactional email provider before enabling new registrations.

External services

SMSocial does not contact a fixed external service unless a site administrator or member uses a feature that requires it. The following connections can occur:

- Postmark API (optional transactional email): used only when the administrator selects Postmark and supplies a server token. Recipient email addresses, message content and delivery metadata required to send the message are transmitted when SMSocial sends transactional email. Service: <https://postmarkapp.com/> ; Terms: <https://postmarkapp.com/terms-of-service> ; Privacy: <https://postmarkapp.com/privacy-policy>
- Custom SMTP (optional transactional email): used only when the administrator supplies an SMTP server. Recipient email addresses, message content, delivery metadata and the configured SMTP credentials are sent to that administrator-selected mail server when email is sent. The terms and privacy policy are those of the SMTP provider selected by the administrator.
- External link previews: when a member asks SMSocial to preview a public external URL, the site server sends a bounded HTTP GET request to the URL supplied by that member so it can read public title, description, image and article-preview metadata. The remote website receives the normal server network

information, the requested URL and HTTP headers; SMSocial's User-Agent also identifies the SMSocial version and the WordPress site's home URL. No SMSocial password or private account credential is sent. Because the destination is chosen by the member rather than being a fixed SMSocial provider, that destination website's own terms and privacy policy apply.

- YouTube embedded player: when a post containing a supported YouTube link is viewed, the browser can load the privacy-enhanced YouTube player from youtube-nocookie.com. The video identifier and normal browser/network request information are sent to Google/YouTube. Terms: <https://www.youtube.com/static?template=terms> ; Privacy: <https://policies.google.com/privacy>
- Vimeo embedded player: when a post containing a supported Vimeo link is viewed, the browser can load player.vimeo.com. The video identifier and normal browser/network request information are sent to Vimeo. Terms: <https://vimeo.com/legal/> ; Privacy: <https://vimeo.com/privacy>
- TikTok embedded player: when a post containing a supported TikTok video link is viewed, the browser can load www.tiktok.com/player/. The video identifier and normal browser/network request information are sent to TikTok. Terms: <https://www.tiktok.com/legal/page/eea/terms-of-service/en> ; Privacy: <https://www.tiktok.com/legal/page/eea/privacy-policy/en>
- Dailymotion embedded player: when a post containing a supported Dailymotion link is viewed, the browser can load www.dailymotion.com/embed/. The video identifier and normal browser/network request information are sent to Dailymotion. Terms: <https://legal.dailymotion.com/en/terms-of-use/> ; Privacy: <https://legal.dailymotion.com/en/privacy-policy/>

These connections are feature-driven; SMSocial does not transmit a site's member database to these providers.
