

# WP Force SSL & HTTPS Redirect

<https://wpdemo.net/demos/plugins/wp-force-ssl>

WP Force SSL WordPress plugin allows you to redirect insecure HTTP traffic to secure HTTPS one without touching any code. Just activate Force SSL plugin and everything will be configured for you and SSL enabled. The entire site will move to HTTPS using your own SSL certificate. It works with any SSL certificate. It can be free SSL certificate from Let's Encrypt or a paid SSL certificate.

How to add SSL & enable SSL? Most hosting companies support the free SSL certificate from Let's Encrypt, so just login to your hosting panel and add SSL certificate for free. You'll probably see a button labeled "Add SSL Certificate" or "Add Let's Encrypt Certificate" and after that it's 1 click to have the SSL enabled on your site.

To keep things fast & simple WP Force SSL is very lightweight - there are only two settings. Access options via main Settings menu - Force SSL.

## **THREE FAST STEPS TO GET YOU STARTED:**

Get an SSL certificate

Activate WP Force SSL.

Test certificate & you're done!

## **SSL CERTIFICATE TESTING TOOL**

WP Force SSL comes with an SSL certificate testing tool. Simply click "Test SSL certificate" and it'll test if the certificate is valid, properly installed, up-to date, and generally in good shape to be used on your site so you can force SSL.
